Critical appraisal checklists and reporting guidelines

Doug Altman

The EQUATOR Network workshop
31 October 2013, WHO, Geneva
Guidelines and Checklists

- **Study conduct**
  - Researchers: How to do it (well)

- **Reporting guidelines**
  - To ensure full information is provided about study methods and findings
  - Researchers: how to report the study
  - Peer reviewers: assess adequacy of reporting

- **Critical appraisal**
  - Reviewers/readers: Assess adequacy of study methods
Critical appraisal: observational comparative effectiveness studies

A Validated Checklist
for Evaluating the Quality of Observational Cohort Studies for Decision-Making Support

Were important covariates that may be known confounders or effect modifiers available and recorded?

Important covariates depend on the treatment and/or outcome of interest, (e.g., body mass index should be available and recorded for studies of diabetes; race should be available and recorded for studies of hypertension and glaucoma).

- Yes—most if not all important known confounders and effect modifiers available and recorded, e.g., measures of medication dose and duration.

- No—at least one important known confounder or effect modifier not available and recorded (as noted by authors or as determined by user’s clinical knowledge), or not enough information in article.

Comments:
Critical appraisal: **systematic review**

Table 2: AMSTAR is a measurement tool created to assess the methodological quality of systematic reviews.

<table>
<thead>
<tr>
<th>Question</th>
<th>Yes</th>
<th>No</th>
<th>Can't answer</th>
<th>Not applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Was an 'a priori' design provided?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The research question and inclusion criteria should be established before the conduct of the review.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2. Was there duplicate study selection and data extraction?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>There should be at least two independent data extractors and a consensus procedure for disagreements should be in place.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. Was a comprehensive literature search performed?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>At least two electronic sources should be searched. The report must include years and databases used (e.g. Central, EMBASE, and MEDLINE). Key words and/or MESH terms must be stated and where feasible the search strategy should be provided. All searches should be supplemented by consulting current contents, reviews, textbooks, specialized registers, or experts in the particular field of study, and by reviewing the references in the studies found.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4. Was the status of publication (i.e. grey literature) used as an inclusion criterion?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The authors should state that they searched for reports regardless of their publication type. The authors should state whether or not they excluded any reports (from the systematic review), based on their publication status, language etc.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5. Was a list of studies (included and excluded) provided?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>A list of included and excluded studies should be provided.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Critical appraisal

- Cannot assess the methods used if those methods are not described in adequate detail

- Good reporting is necessary for judging study methods;
  - Relevance
  - Reliability
  - etc
A cluster randomised trial?

ARTICLE

Promotion and Provision of Drinking Water in Schools for Overweight Prevention: Randomized, Controlled Cluster Trial

Rebecca Muckelbauer, MSc\textsuperscript{a}, Lars Libuda, MSc\textsuperscript{a}, Kerstin Clausen, PhD\textsuperscript{a}, André Michael Toschke, MD, MSc, MPH\textsuperscript{b}, Thomas Reinehr, MD\textsuperscript{c}, Mathilde Kersting, PhD\textsuperscript{a}

*Pediatrics* 2009;123;e661-7
The study population comprised children attending the second and third grades of elementary schools in deprived neighborhoods of 2 neighboring cities, namely, Dortmund and Essen, Germany ...

Schools in Dortmund represented the intervention group (IG) and schools in Essen the control group (CG). For each city, 20 schools were selected randomly (Fig 1).
Good (clear) reporting

Sequence generation:

- “Independent pharmacists dispensed either active or placebo inhalers according to a computer generated randomization list.”
- “... The randomization code was developed using a computer random number generator to select random permuted blocks. The block lengths were 4, 8, and 10 varied randomly ...”
Unclear reporting

“Patients were assigned to either the intervention or control group, by selection of a card from a pile of equal numbers of cards for each group.”

Clear reporting but poor methodology

“Randomization was alternated every 10 patients, such that the first 10 patients were assigned to early atropine and the next 10 to the regular protocol, etc. To avoid possible bias, the last 10 were also assigned to early atropine.”
## Reporting vs conduct: study methods

**METHODS – each aspect of the methods**

<table>
<thead>
<tr>
<th></th>
<th>Done well</th>
<th>Done poorly</th>
<th>Not done</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fully reported (=reproducible)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ambiguously or incompletely reported</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Not reported</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Assessing risk of bias

A critical element of a systematic review

- Risk of bias results from suboptimal methods
- Methods need to be reported well to allow assessment of risk of bias

## Reporting vs conduct: results

### RESULTS – for each analysis

<table>
<thead>
<tr>
<th></th>
<th>Exactly as pre-specified</th>
<th>Explicitly not pre-specified</th>
<th>Post hoc but not declared as such</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fully reported (= can be included in meta-analysis)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ambiguously or incompletely reported</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Not reported</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Good reporting is essential

- Quality of reporting is a key factor in determining the value of a research publication
- It is impossible to appraise a study if the report lacks key information
- Full reporting of results is essential to allow a study to be included in a meta-analysis
What is a reporting guideline?

- Specify a minimum set of items required for a clear and transparent account of what was done and what was found in a research study
- Reflect in particular issues that might introduce bias into the research
- Format: Checklist, flow diagram, text
Example of a reporting guideline

- Most internationally accepted RGs
  - Based on evidence
  - Consensus of relevant stakeholders (multidisciplinary group)
“Moreover, the CONSORT 2010 statement does not include recommendations for designing and conducting randomized trials. The items should elicit clear pronouncements of how and what the authors did, but do not contain any judgments on how and what the authors should have done. Thus, CONSORT 2010 is not intended as an instrument to evaluate the quality of a trial. Nor is it appropriate to use the checklist to construct a “quality score.””
Why not to calculate a score

- **Items on checklist are there for various reasons**
  - Internal validity
  - External validity
  - Indexing/retrieval
  - Reproducibility of methods
“By itself, accurate, transparent reporting doesn’t make good science. Knowing that editors expect a high standard of accuracy and transparency in reports of finished research can, however, encourage researchers do a better job in planning and carrying out the research in the first place. Accurate, transparent reporting is like turning the light on before you clean up a room: It doesn’t clean it for you, but does tell you where the problems are.”

Summary

- Guidelines for reporting and for critical appraisal are quite distinct

- Several checklists are relevant to systematic reviews
  - for assessing methods of the primary studies
  - for reporting the review
  - for assessing methods of the review

- Good reporting is essential
  - to enable the methodology to be understood and appraised
  - to enable the findings to be included in a future meta-analysis
